

Comprehensive Health Profile Summary (2017-2025)

This document synthesizes your health data into three key profiles: the Lipid Profile, the Cardiovascular Profile, and the Whole Blood Biochemical Profile. The analysis is based on lab reports from December 2017 to September 2025.

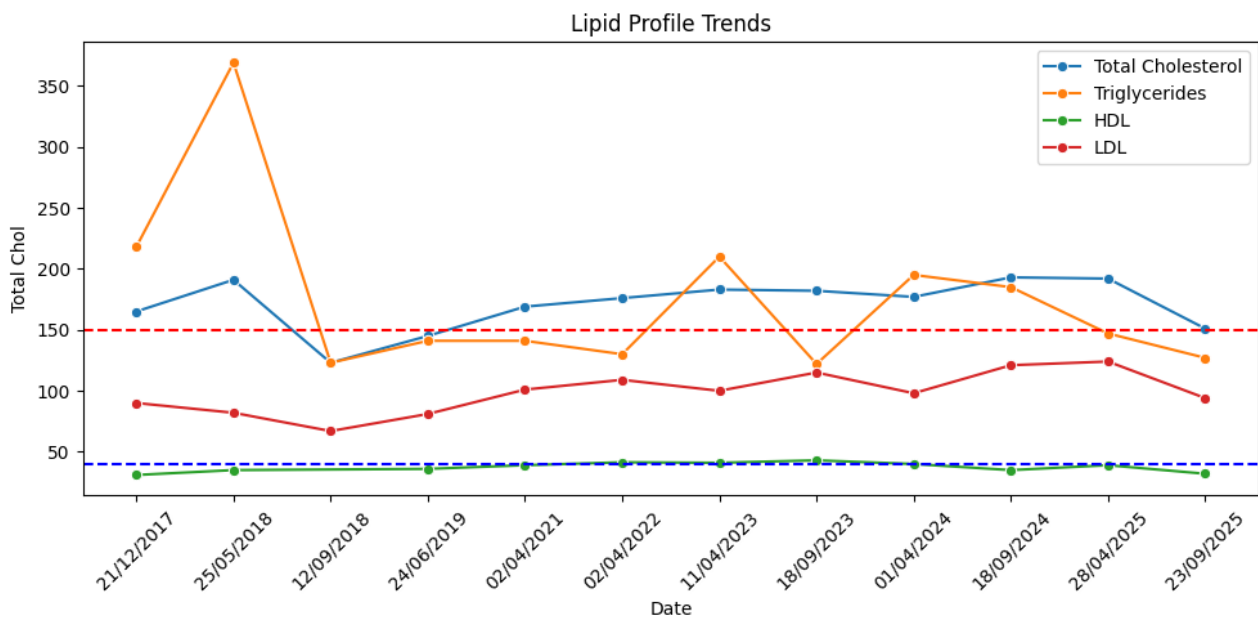

Triglycerides (mg/dL)	127.0	< 150	Abnormal
HDL Cholesterol (mg/dL)	32.0	> 40	Abnormal
LDL Cholesterol (mg/dL)	94.0	< 116	Abnormal
Non-HDL Cholesterol (mg/dL)	153.0	< 130	Borderline
HbA1c (%)	5.0	4.0 - 5.6	Normal
CRP (mg/L)	0.2	< 5.0	Abnormal
Total Bilirubin (mg/dL)	3.99	< 1.5	Borderline
Ferritin (ng/mL)	245.3	30 - 300	Normal

This executive summary provides a quick visual snapshot of your most critical markers with color-coded flags for easy identification of areas needing attention.

Your lipid profile shows dyslipidemia - high triglycerides, low HDL, and occasional LDL elevation.

- Triglycerides: Often above the <150 mg/dL target, spiking to 369 mg/dL (2018) and 210 mg/dL (2023).
- HDL: Persistently under target (>40 mg/dL), down to 32 mg/dL in late 2025.
- LDL: Elevated in 2024-25 (121-124 mg/dL), normalized to 94 mg/dL by Sept 2025.
- Non-HDL: Borderline-high at 153 mg/dL in April 2025.

Date	Total Chol	Trig	HDL	LDL
21/12/2017	165	218	31.0	90
25/05/2018	191	369	35.0	82
12/09/2018	123	123		67
24/06/2019	145	141	36.0	81
02/04/2021	169	141	39.0	101
02/04/2022	176	130	41.4	109
11/04/2023	183	210	41.0	100
18/09/2023	182	122	43.0	115
01/04/2024	177	195	40.0	98
18/09/2024	193	185	35.0	121
28/04/2025	192	147	39.0	124
23/09/2025	151	127	32.0	94

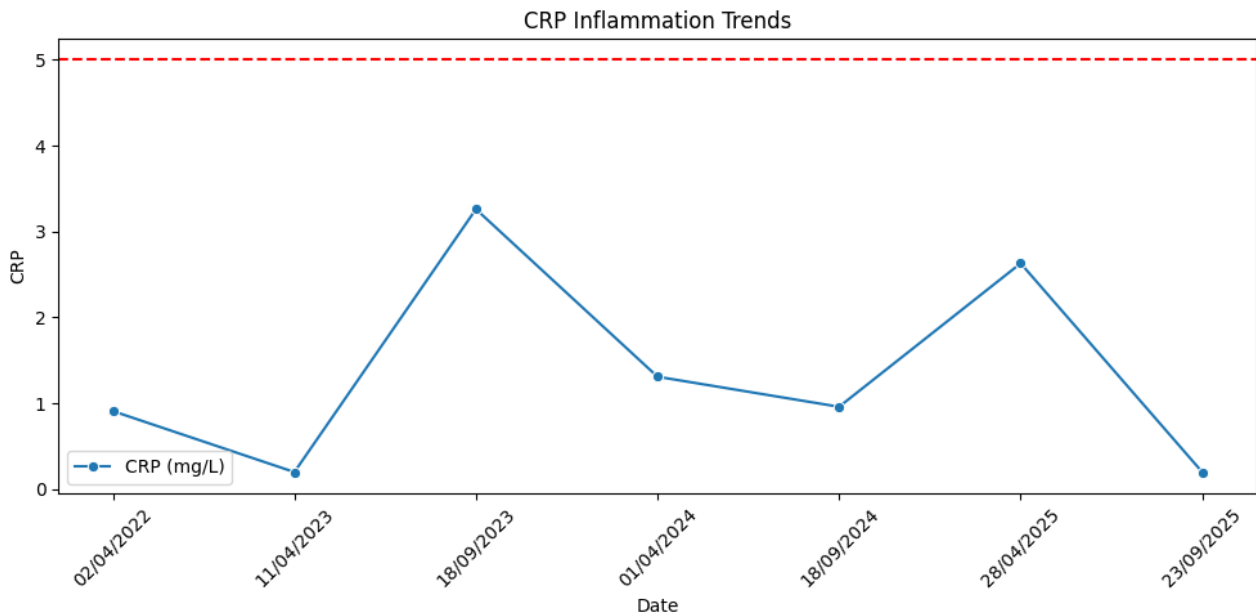

Cardiovascular health drivers:

- Dyslipidemia (high triglycerides + low HDL) remains primary risk factor.
- Strengths include excellent glucose control (HbA1c ~5.0-5.2%) and persistently low systemic inflammation (CRP < 3 mg/L, except Sept 2023).

Overall: Low inflammation and healthy glucose largely offset lipid-related risks.

Date	CRP	HbA1c
21/12/2017		
25/05/2018		
24/06/2019		
02/04/2021		
02/04/2022	0.91	
11/04/2023	0.2	
18/09/2023	3.26	
01/04/2024	1.31	5.2
18/09/2024	0.96	5.1
28/04/2025	2.63	
23/09/2025	0.2	5.0

- Liver enzymes normalized after 2017, but bilirubin levels remain chronically high (>1.5 mg/dL), recently nearing 4.0 mg/dL.
- Ferritin spiked >500 ng/mL in 2018, 2022, and 2023 - now decreased to ~245 ng/mL (Sept 2025).
- TSH remained stable across years, indicating normal thyroid function.

Date	Bilirubin	Ferritin
21/12/2017		
25/05/2018		531.8
24/06/2019		364.1
02/04/2022		512.0
11/04/2023	2.26	546.0
18/09/2023	2.13	
01/04/2024	2.58	258.2
18/09/2024	1.83	289.6
23/09/2025	3.99	245.3
